Fishing Grabs

FISHING GRAB

The Fishing Grab is a tool used to retrieve wire that has broken in the tubing.

The Fishing Grab consists of a box up connection in a housing with either two or three flexible prongs extending downwards. Pointed barbs are welded to the inside of the prongs so as to form hooks that will catch the looped end of the broken line. The Coiled Tubing Fishing Grab also has a large flow through bore.

When a line breaks below the stuffing box, a full gauge such as a slotted skirt wirefinder is normally used to both locate and ball up the broken end of the line before running the Fishing Grab. The Fishing Grab is flexible enough to bend and can be gauged for the tubing it is to be run in. The prong ends of the grab should fit snugly against the walls of the tubing to help prevent line bypass.

For further details and available sizes, please contact NOV.

Features/Benefits

- Flow through facility
- Simple flexible design
- Robust construction
- External fish neck available

When ordering Fishing Grabs please specify:

- Size
- Thread connection
