

Mission™ Custom Dies and Inserts

NOV's Mission™ dies and inserts for manual tongs, power tongs, drill pipe, drill collar and casing slips, safety clamps, tubing and casing elevators are accurately machined to exacting tolerances using state of the art CNC machinery. All dies and inserts are then heat treated to specific standards to provide the best resistance to wear even in the harshest environments. These standards produce a product of superior performance and consistent quality.

We also offer dies and inserts for experimental and custom designed equipment. Our engineering and

design staff continually evaluates new designs and concepts to improve performance of new and existing handling tool equipment.

At Mission's custom die and insert facilities, our quality and product consistency are industry standards. Through years of engineering, design innovation and state of the art machinery we are able to produce superior quality and competitively priced products.

Mission's line of custom die and insert products are distributed worldwide extensively by agents, distributors and authorized suppliers.
